

## CLAIMS

What is claimed is:

1. A method of protecting a mobile wireless user via a firewall application in a wireless transceiver:
  - 5 defining a mobile user profile indicative of a desired firewall configuration corresponding to the mobile user;  
establishing the firewall configuration at a firewall application in the wireless transceiver corresponding to the current location of the mobile user, the wireless transceiver operable for wireless communication with the mobile user
  - 10 via a wireless access unit; and  
establishing the same firewall configuration at another wireless transceiver when the user is located in the area corresponding to the another wireless transceiver.
- 15 2. The method of claim 1 wherein the firewall configuration is indicative of a set of firewall characteristics corresponding to a particular mobile user.
3. The method of claim 1 wherein the firewall is operable to selectively provide authorized access via the wireless transceiver.
4. The method of claim 1 wherein the wireless transceiver is a Base Station  
20 Processor (BSP).
5. The method of claim 1 wherein the wireless transceiver is an internetworking gateway in communication with a Base Station Processor (BSP).

09647865-050301

6. The method of claim 2 wherein the firewall configuration corresponding to each of a plurality of mobile users is stored in central repository.
7. The method of claim 6 wherein the central repository is a Wireless Internet Facility (WIF).
- 5 8. The method of claim 2 wherein establishing further comprises an indexed lookup according to a unique identifier indicative of the particular mobile user.
9. The method of claim 8 wherein the unique identifier is an index selected from the group consisting of a subscriber ID and an electronic serial number (ESN).
- 10 10. The method of claim 1 wherein the firewall is located on a wired network side of wireless link.
11. The method of claim 10 wherein the wired side corresponds to an ISP side of the wireless link, the ISP side connected to a public access network.
12. The method of claim 3 further comprising selectively allowing message packet transmissions by determining if a message packet corresponds to the firewall characteristics of a particular mobile user profile.
- 15 13. The method of claim 12 wherein the firewall characteristics are selected from the group consisting of port numbers, application IDs, source, destination, content filters, IP address, machine names, virus detection, password scanning, denial of service detection, and TCP/IP flags.
- 20 14. A system for protecting a mobile wireless user via a firewall comprising:

a subscriber access unit in communication with the mobile wireless user, the access unit operable to transmit and receive wireless transmissions;

a wireless transceiver in wireless communication with the access unit, the wireless transceiver operable for communication via a public access network;

a firewall application in the wireless transceiver, the firewall application operable to establish a firewall configuration to selectively forward wireless transmissions according to a mobile user profile corresponding to the mobile wireless user; and

a handoff manager operable to establish communications with a second wireless transceiver when the mobile wireless user is in an area corresponding to the second wireless transceiver, wherein the communications with the second wireless transceiver corresponds to the mobile user profile.

15. The system of claim 14 wherein the firewall is operable to selectively provide authorized access via the wireless transceiver.
16. The system of claim 14 wherein the wireless transceiver is a Base Station Processor (BSP).
17. The system of claim 14 wherein the wireless transceiver is an internetworking gateway in communication with a Base Station Processor (BSP).
18. The system of claim 14 further comprising a unique identifier indicative of the particular mobile user, the unique identifier adapted for an indexed lookup of the mobile user profile.
19. The system of claim 18 wherein the unique identifier is an index selected from the group consisting of a subscriber ID and an electronic serial number (ESN).

20. The system of claim 14 wherein the firewall configuration is indicative of a set of firewall characteristics corresponding to a particular mobile user.
21. The system of claim 14 further comprising a central repository, wherein the firewall configuration corresponding to each of a plurality of mobile users is stored in the central repository.
22. The system of claim 21 wherein the central repository is a Wireless Internet Facility (WIF).
23. The system of claim 14 wherein the firewall is located on wired network side of wireless link.
24. The system of claim 14 wherein the wired side corresponds to an ISP side of the wireless link.
25. The system of claim 14 wherein the firewall is operative to selectively allow message packet transmissions by determining if a message packet corresponds to the firewall characteristics of a particular mobile user profile.
26. The system of claim 25 wherein the firewall characteristics are selected from the group consisting of port numbers, application IDs, source, destination, content filters, IP address, machine names, virus detection, password scanning, denial of service detection, and TCP/IP flags.
27. A method of protecting mobile wireless users via a firewall application in a base station comprising:  
defining a first mobile user profile indicative of a desired firewall configuration corresponding to the first mobile user;

establishing the firewall configuration at a firewall application in the base station;

defining a second mobile user profile indicative of a desired firewall configuration corresponding to a second mobile user;

5 establishing the firewall configuration at a firewall application in the base station;

receiving message packets at the base station;

when the message packets are directed to the first mobile user, determining, according to the first mobile user profile, whether to forward the message packets to the first mobile user; and

10 when the message packets are directed to the second mobile user, determining, according to the second mobile user profile, whether to forward message packets directed to the second mobile user.

15 28. The method of claim 27 wherein the first mobile user profile and the second mobile user profile are different.

29. A computer program product having computer program code for protecting a mobile wireless user via a firewall application in a wireless transceiver comprising:

20 computer program code for defining a mobile user profile indicative of a desired firewall configuration corresponding to the mobile user;

computer program code for establishing the firewall configuration at a firewall application in the wireless transceiver corresponding to the current location of the mobile user, the wireless transceiver operable for wireless communication with the mobile user via a wireless access unit; and

25 computer program code for establishing the same firewall configuration at another wireless transceiver when the user is located in the area corresponding to the another wireless transceiver.

30. A computer data signal for protecting a mobile wireless user via a firewall application in a wireless transceiver comprising:
- program code for defining a mobile user profile indicative of a desired firewall configuration corresponding to the mobile user;
  - 5 program code for establishing the firewall configuration at a firewall application in the wireless transceiver corresponding to the current location of the mobile user, the wireless transceiver operable for wireless communication with the mobile user via a wireless access unit; and
  - 10 program code for establishing the same firewall configuration at another wireless transceiver when the user is located in the area corresponding to the another wireless transceiver.
31. A system for protecting a mobile wireless user via a firewall comprising:
- means for defining a mobile user profile indicative of a desired firewall configuration corresponding to the mobile user;
  - 15 means for establishing the firewall configuration at a firewall application in the wireless transceiver corresponding to the current location of the mobile user, the wireless transceiver operable for wireless communication with the mobile user via a wireless access unit; and
  - 20 means for establishing the same firewall configuration at another wireless transceiver when the user is located in the area corresponding to the another wireless transceiver.
32. A system for protecting a mobile wireless user via a firewall comprising:
- 25 an access unit in communication with the mobile wireless user, the access unit operable to transmit and receive wireless transmissions via a wireless network;

a wireless network access gateway connected to a public access network and operable to provide a access between the wireless network and a public access unit;

5 a plurality of wireless transceivers, the wireless transceivers in selective wireless communication with the access unit;

a firewall application in the wireless network access gateway, the firewall application operable to establish a firewall configuration to selectively forward wireless transmissions according to a mobile user profile corresponding to the mobile wireless user; and

10 a handoff manager operable to establish the selective communications with a second wireless transceiver when the mobile wireless user is in an area corresponding to the second wireless transceiver, wherein the communications with the second wireless transceiver corresponds to the mobile user profile.
